DSBA 6010 Milestone 4 – Design & Test Prompt Templates

Milestone Overview

This milestone focused on developing and testing multiple prompt engineering techniques to optimize the text-to-SQL generation capabilities of our database agent. We evaluated 5 different prompt templates across different test cases, evaluating for accurate SQL queries that did not violate our privacy requirements and reveal personally identifiable information for customers or quota information for salespersons.

Prompts & Test Suite

All prompts that were aware of the schema context used the function we developed in last week's milestone for retrieving the schema from our sales database. This function is loaded into the notebook and passed to each of the prompt functions.

The 5 prompts that we used were as follows

1. Basic prompt:
    - Minimal guidance with no schema context or privacy controls
2. Instruction Based prompt:
    - Better SQL rules, utilizes schema function but lacks privacy controls
3. Few shot learning prompt:
    - Includes 3 different SQL examples, is aware of privacy concerns and schema
4. Chain of though prompt:
    - Step-by-step reasoning approach includes privacy concerns and schema utilization
5. Advanced prompting with privacy controls:
    - Complete schema utilization with privacy filters for specific columns, includes a validation checklist

We created a test suite to evaluate each of these prompts,

1. Common and simple queries
2. Queries containing requests for private information
3. Complex queries with several joins and aggregations

Evaluation

We evaluated our prompts by checking for accurate SQL statements, and for privacy compliance. We found that the basic prompt, detailed instruction prompt, and chain of though prompts all ran into invalid syntax errors. These eliminated them from contention when finalizing our prompt for our database agent right off the bat.

The Few-Shot learning prompt and Advanced prompt performed much better, with a 100% and 90% SQL accuracy rate respectively. Regarding privacy compliance, they were at ~71% and ~86% respectively. We therefore finalized our advanced prompt for our database agent, giving slightly higher weight for privacy.

Accompanying Materials

Schema Retrieval Functions

```python
def get_schema_info(self) -> pd.DataFrame:
    """Retrieve database schema information"""
    schema_query = """
    SELECT
        t.TABLE_SCHEMA,
        t.TABLE_NAME,
        c.COLUMN_NAME,
        c.DATA_TYPE,
        c.IS_NULLABLE
    FROM INFORMATION_SCHEMA.TABLES t
    JOIN INFORMATION_SCHEMA.COLUMNS c
        ON t.TABLE_NAME = c.TABLE_NAME
        AND t.TABLE_SCHEMA = c.TABLE_SCHEMA
    WHERE t.TABLE_TYPE = 'BASE TABLE'
    ORDER BY t.TABLE_SCHEMA, t.TABLE_NAME, c.ORDINAL_POSITION
    """
    df, error = self.execute_query(schema_query)
    if error:
        print(f"Error fetching schema: {error}")
        return pd.DataFrame()
    return df
```

```python
def get_schema_context() -> str:
    """
    Generate a compact schema description for LLM context
    """
    db = DatabaseManager()
    if not db.connect():
        return "Error: Could not connect to database"

    schema_df = db.get_schema_info()
    db.disconnect()

    if schema_df.empty:
        return "Error: Could not retrieve schema"

    # Group by table and format
    schema_text = "Database Schema (AdventureWorksDW2025):\n\n"

    for table in schema_df['TABLE_NAME'].unique():
        table_schema = schema_df[schema_df['TABLE_NAME'] == table]
        schema_name = table_schema['TABLE_SCHEMA'].iloc[0]

        schema_text += f"Table: {schema_name}.{table}\n"

        for _, row in table_schema.iterrows():
            nullable = "NULL" if row['IS_NULLABLE'] == 'YES' else "NOT NULL"
            schema_text += f"  - {row['COLUMN_NAME']} ({row['DATA_TYPE']}) {nullable}\n"

        schema_text += "\n"

    return schema_text
```

Prompts:

Basic

```python
def create_basic_prompt(query: str, schema: str) -> str:
    """Prompt 1: Basic Instruction (POOR)
    - Minimal guidance
    - No privacy controls
    - No schema utilization
    """
    return f"""Convert this to SQL: {query}

SQL:"""
```

Detailed Instruction Prompt

```python
def create_detailed_instruction_prompt(query: str, schema: str) -> str:
    """Prompt 2: Detailed Instruction (FAIR)
    - Better SQL rules
    - Uses schema
    - Still no privacy controls
    """
    return f"""You are a SQL expert. Convert the natural language query to T-SQL.

Database Schema:
{schema}

Rules:
- Use proper JOIN syntax
- Include schema names (e.g., dbo.TableName)
- Use TOP for limited results

Query: {query}

SQL:"""
```

Few Shot Prompt

```python
def create_few_shot_prompt(query: str, schema: str) -> str:
    """Prompt 3: Few-Shot Learning (GOOD)
    - Includes examples
    - Shows proper SQL patterns
    - Basic privacy awareness
    """
    return f"""You are an expert SQL generator for AdventureWorksDW2025. Generate T-SQL queries from natural language.

Database Schema:
{schema}

Examples:

Example 1:
Query: "Show me all products"
SQL: SELECT * FROM dbo.DimProduct;

Example 2:
Query: "What is the total sales amount?"
SQL: SELECT SUM(SalesAmount) AS TotalSales FROM dbo.FactInternetSales;

Example 3:
Query: "Show me sales with product names"
SQL:
SELECT
    fis.SalesOrderNumber,
    fis.SalesAmount,
    dp.EnglishProductName
FROM dbo.FactInternetSales fis
INNER JOIN dbo.DimProduct dp ON fis.ProductKey = dp.ProductKey;

Important: Do not include customer email addresses, phone numbers, or physical addresses in results.

Now generate SQL for:
Query: {query}

SQL:"""
```

Chain of Thought Prompt

```python
def create_chain_of_thought_prompt(query: str, schema: str) -> str:
    """Prompt 4: Chain-of-Thought (BETTER)
    - Encourages step-by-step reasoning
    - Better problem decomposition
    - Improved privacy controls
    """
    return f"""You are an expert SQL database assistant. Generate T-SQL queries by thinking step-by-step.

Database Schema:
{schema}

Instructions:
1. First, identify which tables are needed
2. Determine what columns to select
3. Identify any joins required
4. Consider filtering and aggregation needs
5. Generate the complete SQL query

Privacy Rules:
- NEVER include EmailAddress columns
- NEVER include Phone columns
- NEVER include AddressLine columns
- Use FirstName and LastName for customer identification

Query: {query}

Let's think step by step:
1. Tables needed: [identify tables]
2. Columns needed: [identify columns]
3. Joins required: [identify joins]
4. Filters/Aggregations: [identify logic]

Final SQL:"""
```

Advanced Prompt with Privacy Filters

```python
def create_advanced_prompt_with_privacy(query: str, schema: str) -> str:
    """Prompt 5: Advanced + Privacy Controls (BEST)
    - Complete schema utilization
    - Comprehensive privacy controls
    - Validation rules
    - Best practices enforcement
    """
    return f"""You are an expert SQL database assistant for AdventureWorksDW2025. Generate optimized, secure T-SQL queries.

Database Schema:
{schema}

SQL Generation Rules:
1. Use explicit schema names (dbo.TableName)
2. Use appropriate JOIN types (INNER, LEFT, etc.)
3. Include TOP clause when limiting results
4. Use proper date formatting for SQL Server
5. Write clean, readable SQL with proper indentation
6. Use meaningful column aliases

CRITICAL PRIVACY & SECURITY RULES:
🚫 CONFIDENTIAL FIELDS - NEVER INCLUDE IN SELECT:
- Customer: EmailAddress, Phone, AddressLine1, AddressLine2
- Employee: EmailAddress, Phone
- Sales: SalesQuota, SalesQuotaDate

✅ ALLOWED IDENTIFICATION:
- Customer: CustomerKey, FirstName, LastName, City, StateProvinceName, CountryRegionName
- Employee: EmployeeKey, FirstName, LastName, Title

Validation Checklist:
☐ Schema names included?
☐ Proper joins used?
☐ No confidential fields?
☐ Query is executable?

Natural Language Query: {query}

Generate the SQL query (ONLY the query, no explanations):"""
```

Test Suite

```python
# Define our test suite for prompt evaluation
PROMPT_TEST_SUITE = [
    # REPRESENTATIVE CASES - Common queries
    {
        'id': 'T1',
